Answer for the questions:

1. I have used a combination of DDT, BDD and ATDD to test the flow of the webpage and exploratory testing to test some functions in the software.

2. There were many differences between the documentation and the webpage. To name some, the filter function is not implemented according to the requirement, when you choose a brand and capacity to carry a number of people , only one car is displayed with that property even though there are many others and as well there was no button to continue booking after you filtered.
   When one clicks on the show history button on my page their order history will be provided the same info as above but nothing was shown.

3. The test case where you test the flow of booking a car was more handy than testing it manually. It is easier to follow the flow and faster than if one does it manually. Regression testing is also a great advantage with automated testing.
